

Project Sentinel Architecture Guide

Continuous Identity Trust Framework

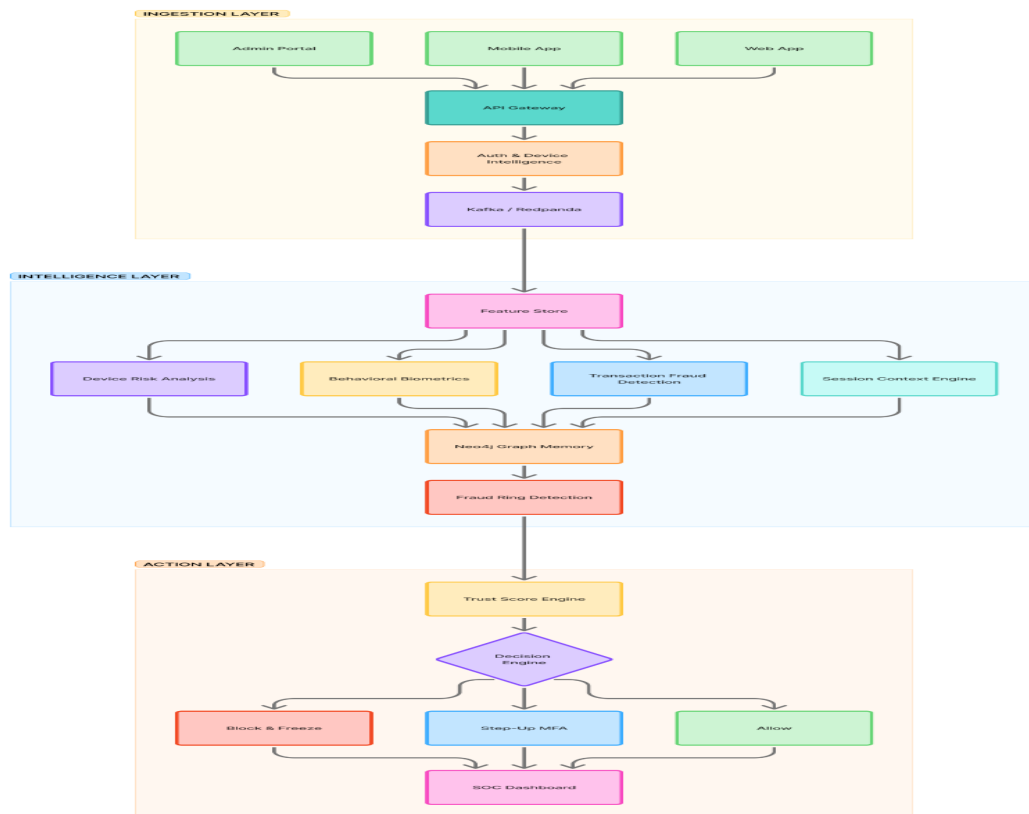

Explains the overall vision. Sentinel continuously evaluates user trust instead of relying only on login-time authentication. Behavioral analytics, graph intelligence and adaptive security drive decisions.

Prototype Architecture

Shows the hackathon implementation. Telemetry flows through the API Gateway into the Behavioral Risk Engine and Neo4j Graph Memory. Both contribute to a Continuous Trust Score which drives Allow, MFA or Block decisions.

Enterprise Fraud Intelligence Platform

Production-scale architecture with Ingestion, Intelligence and Action layers. Includes event streaming, feature engineering, fraud detection services, graph intelligence, trust scoring and SOC operations.
